	Urgent	**Not Urgent**
Important	**Do - (Your MVP)** ● Get user input. ● Calculate population growth. ● Output the population growth result to the screen.	**Schedule - (For V2.0+)** ● Make the graph super interesting to see, colorful, etc. ● Make the input visually stimulating, colorful, etc. ● Use ipywidgets to make the program look like a website and be more interactive, like a button to signal the graph to pop up.
Not Important	**Delegate - (Use a library)** ● Make the graph using the pandas library. ● Use the existing logistical growth model for the calculation. ● Use .inputs() to get the input instead of making something else to do that.	**Delete - (Cut it)** ● Make a visual of a petri dish with the growth change visible, like a time lapse. ● Make the person able to choose what bacteria that they want to model changes from. ● Make the graph interactable, zoomable and clickable.
